

### **Client Problem**

Some time users need login page rather than login prompt but he want to authentication users from active directory not from database.

### **Royal Cyber Solution**

Royal Cyber Inc is suggesting you to implement Form Based Authentication with active directory,

Active Directory (AD) is providing you to user management, you never to manage user separately for your sharepoint site, your network administrator responsible for it. You just add users into your site and give permission. You see Login page if you enable Form based authentication on site from central administration
